

How to Access “Anaconda Powershell Prompt”

STEP 1: Make sure that you have successfully downloaded the most up to date version of Anaconda.

STEP 2: After ensuring that you have correctly downloaded Anaconda, you can now type into your search bar “Anaconda” and a few things should pop up.

STEP 3: Looking at the image above, there are two versions of “Anaconda Prompt”:
“Anaconda Powershell Prompt” and “Anaconda Prompt”

For what we are doing in CMSE 202, you want to make sure that you are using **“Anaconda Powershell Prompt”** as this allows for you to use unix and Git commands in your terminal locally. (What I did was make a shortcut on my homescreen for ease of access.)

DISCLAIMER: Not all of the commands will work in the same way they do on a linux terminal. For example “curl” works, but the syntax is not the same, this may require looking up additional information from time to time.
